

PS-06

Smart Dealer Enquiry App

AI HACKATHON 2026

Problem Statements

Four themes • One 36-hour sprint

Decision Intelligence

Digital Trust & Compliance

Citizen AI

Enterprise Engineering

13–14 August 2026 • YMSLI Campus

The Four Themes

01

Decision Intelligence

AI-Powered Delivery KPI Dashboard

Turn scattered JIRA data into a live, drill-downable view of project health with NL query and auto-insights.

02

Digital Trust & Compliance

Safeguard our data and our systems

Build AI that safeguards our data, our systems, and the people who trust us.

03

Citizen AI

Solve Your Own Daily Problem

No code. Use Microsoft 365 Copilot to fix a real, everyday task you face at work.

04

Enterprise Engineering

Multiple problems

• **Mobile app** (Visitor Registration App, **Smart Dealer Enquiry App**) • SAP data validation & mapping • Microsoft Smart Template Hub.

THEME: ENTERPRISE ENGINEERING

This theme is about building real, working applications that solve genuine business problems — the kind YMSLI could actually put into a client engagement or an internal operation. Expect to build a functional app: a mobile app for a field or dealer workflow, or a solution that plugs into enterprise platforms like SAP or Microsoft Dynamics to automate data-heavy or document-heavy tasks. These challenges reward solid engineering, clean data handling and thoughtful integration — with AI built into both how you develop and what the app does. Pick this if you're a developer (mobile, full-stack or enterprise) who wants to ship a polished, demo-ready application in 36 hours.

PROBLEM STATEMENT 06

Smart Dealer Enquiry App

Sushant Kumar San

Mentor: Deepak Kumar San

PS-06: Smart Dealer Enquiry App

THEME: ENTERPRISE APP

OBJECTIVE

Build a Flutter mobile app for dealer sales staff to capture customer enquiries at the first touch point — interested model, current bike, tentative purchase date — and manage follow-ups from a simple screen, removing dependence on manual registers.

DESCRIPTION OF THE PROBLEM

- Dealer enquiries start on the showroom floor or in the field, but manual records lead to missed or delayed system entry.
- Too many mandatory fields slow down first-touch capture; staff need a simple, mobile-first flow.
- The result is lost enquiries, weak follow-up discipline, and limited visibility of the retail pipeline and DSR activity.

TYPE OF DATA USED

- Dummy / masked customer enquiry data
- Sample product / model master list
- Sample follow-up & lead-status records
- No real customer PII — consent & DPDP awareness

No dataset will be provided for this problem statement — as part of the challenge, teams must prepare/create their own data, structured in whatever way best supports building and demonstrating the solution.

PS-06 — Expected Solution & Tech Stack

MUST HAVE

- ✓ Login + customer enquiry capture form (model, current bike, purchase date)
- ✓ Follow-up screen with next action & date
- ✓ Basic lead status: New / Follow-up / Closed
- ✓ At least one smart AI feature in the product demo

GOOD TO HAVE

- + Search/filter leads; due & overdue follow-up tags
- + Offline save (local DB) & duplicate mobile-number warning
- + Manager dashboard: today's follow-ups & open leads
- + AI: intent classification, smart follow-up date, note summary

TECH STACK TO USE

Flutter (mobile UI)

SQLite / Hive (offline)

Backend API (auth + leads)

Amazon Bedrock (smart features)

API Gateway + Lambda

DynamoDB / RDS

Amazon Cognito (auth)

GitHub Copilot / Cursor

Disclaimer: These are suggested options to help you get started — feel free to use any other tech stack you're comfortable with to build your solution and achieve the objective of the problem statement. Note: only AWS will be provided for cloud services.
